Mohiadeen Ameer

mohiadeen.ameer@gmail.com | TX | 626 342 9487 | linkedin.com/in/mj-ameer/ | github.com/mjameer/

Principal Software Engineer with 14+ years specializing in Go, Java, Kafka, and cloud modernization across AWS, Azure, and Kubernetes. Architected Dell's OME.Next Job Engine Orchestrator (Go microservices, 10K concurrent jobs) and authored an official Dell whitepaper on Kafka/Grafana observability with open-source reference implementation. Drives multi-year migrations from legacy monoliths to containerized microservices and CDC/event-driven architectures, delivering a 96% reduction in report generation time. Owns platform strategy, reference architectures, and migration playbooks used by 15+ product teams — with measurable wins in latency, availability, and cost. Mentors engineers and aligns architecture decisions with product and business goals.

Skills

- Languages & Scripting:Java (8–21), Spring Boot/Cloud/Batch, Spring WebFlux (reactive)
- Cloud & Orchestration: AWS (EKS, ECS, EC2, S3, DynamoDB, RDS, CloudFront, Route 53, Cognito), Azure (AKS, Cosmos DB), OpenShift, Kubernetes, K3s, Helm, Podman, Docker
- CI/CD & IaC: Terraform, CloudFormation, Jenkins, GitHub Actions, SonarQube, Artifactory, Maven
- Observability & Incident Response: Prometheus, Grafana, Loki, Tempo, VictoriaMetrics, VictoriaLogs, Vector, CloudWatch, Dynatrace, Splunk
- Distributed Systems & Messaging: Kafka, Debezium CDC, CQRS, ValKey, Redis, Elasticsearch, gRPC
- Databases: PostgreSQL, MySQL, Oracle, PgBouncer, ShardingSphere

Certifications

- CKAD: Certified Kubernetes Application Developer, Dec 2023
- Confluent Kafka, Aug 2023
- Microsoft Certified: Azure DevOps Engineer Expert, Jan 2022

Principal Software Engineer,

Dell Technologies, Round Rock, TX (Apr 2025 to Present)

- AI Infrastructure (Dell OpenManage Enterprise): Extending the Job Engine Orchestrator and Kafka observability pipeline to orchestrate and monitor AI-ready data centers — discovering and managing ~100K servers, scaling job execution to 10K concurrent jobs, with real-time GPU utilization, power, and thermal telemetry streamed into VictoriaMetrics and Grafana for capacity planning and anomaly detection.
- Kafka/Grafana Observability Pipeline: Authored the official Dell Technologies whitepaper "Visualizing OpenManage Enterprise Alerts and Telemetry in Grafana through Kafka"(January 2026), with an accompanying open-source reference implementation contributed to the OME GitHub repository. The pipeline streams five categories of infrastructure data (inventory, health, alerts, telemetry, and audit logs) through Kafka into VictoriaMetrics and Grafana
- Established the enterprise-wide CDC platform blueprint (PostgreSQL/Debezium/Kafka) that became the reference architecture for next-generation data migration and reporting systems. Decoupling transactional and reporting workloads reduced critical report generation time by 96% (from 5+ minutes to under 10 seconds)
- Architected and operated a Change Data Capture pipeline using Debezium (Strimzi KafkaConnect) and PostgreSQL logical replication — streaming committed row changes from a ome_cdc replication slot across tables (inventory, alerts, jobs, audit logs) into Kafka topics (events.pg.*); downstream Go consumers (search-indexer, data-export) maintained a real-time OpenSearch search index across ~100K device records and a customer telemetry export stream, eliminating dual-write complexity and polling overhead
- Engineered a comprehensive observability stack combining Loki (logs), Tempo (tracing), and Prometheus/Grafana (metrics) for cross-signal telemetry correlation. Integrated OME alerts with centralized monitoring and built pre-built Grafana dashboards covering CPU, GPU and power metrics.

Staff Software Engineer,

Tp-Link Systems Inc, Irvine, CA (Oct 2024 to Apr 2025)

- Operated multi-cloud infrastructure (AWS, Azure, Oracle Cloud) serving millions of IoT devices — owned regional routing validation, failover monitoring, and cross-cloud incident response
- Troubleshot container networking and performance issues — debugged pod-to-pod communication, analyzed resource constraints, deployment configurations
- Architected a compliance-driven multi-cloud backend for the TP-Link Tapo smart home platform serving millions of devices across North America, South America, and Asia-Pacific — dynamically routing device data across AWS (Global), Azure (Brazil/LGPD), and Oracle Cloud (Vietnam/Decree 53) via an Istio service mesh with policy-as-code compliance rules, reducing regional latency by ~40%
- Owned AWS infrastructure for Smart Doorbell platform (EKS/ECS, DynamoDB, S3, CloudFront, Cognito, Route 53) — maintained availability for real-time video streaming and event detection across thousands of devices
- Designed and implemented a horizontally scalable data tier using PostgreSQL sharding with Apache ShardingSphere
- Drove migration of backend services from REST to gRPC, reducing end-to-end request latency by 30–50% and simplifying service-to-service communication patterns.

Cloud Architect,

Client : Kaiser Permanente | Employer : TCS, Pasadena, CA (Jan 2016 to Oct 2024)

- Built and operated SupportPlus — an event-driven automation platform (Azure Event Grid + Azure Functions) that monitored health of 200+ mission-critical healthcare applications, auto-triggered remediation actions (service restart, cache refresh, API failover), and eliminated ~$900K in annual manual support toil; platform was mandated as the standard for application resilience across portfolios
- Owned CI/CD pipelines (Jenkins, SonarQube, Artifactory, Maven) and cloud-native observability stack (Prometheus/Grafana on AKS) — enabled real-time visibility into application and infrastructure health across 15+ product teams
- Led migration of legacy healthcare monoliths to containerized microservices on AWS EKS, Azure AKS, and OpenShift — owned infrastructure provisioning, rollout automation, and rollback procedures

Senior Software Engineer,

Client: Kaiser Permanente, USAA, Target | Employer: TCS, Chennai (Nov 2011 to Jan 2016)

- Served as on-call engineer for 30+ mission-critical healthcare applications — owned incident response, escalation paths, and post-incident documentation across production environments, Executed CI/CD pipeline operations (Jenkins, Artifactory, Maven, GitHub) for migration of 50+ Java web applications — owned build, deployment, and rollback procedures across environments
